Artistic practices have long been disturbing the relationships between art and space. They have challenged the boundaries of performer/spectator, of public/private, introduced intervention and installation, ephemerality and performance, and constantly sought out new modes of distressing expectations about what is construed as art. But when we expand the world in which we look at art, how does this change our understanding of critical artistic practice? This book presents a global perspective on the relationship between art and the city. International and leading scholars and artists themselves present critical theory and practice of contemporary art as a politicised force. It extends thinking on contemporary arts practices in the urban and political context of protest and social resilience and offers the prism of a 'critical artscape' in which to view the urgent interaction of arts and the urban politic. The global appeal of the book is established through the general topic as well as the specific chapters, which are geographically, socially, politically and professionally varied. Contributing authors

come from many different institutional and anti-institutional perspectives from across the world. This will be valuable reading for those interested in cultural geography, urban geography and urban culture, as well as contemporary art theorists, practitioners and policymakers.

The development of the truck in the U.S. from 1895 to 1978 is examined year by year and brief biographies of important early innovators are included

". . . the perfect place to begin, or continue, your education." --Sailing Whether you are shopping for a used fiberglass boat or prioritizing maintenance tasks on the one you already own, this book saves money--and perhaps even disaster. The British and French in the Atlantic 1650-1800 provides a comprehensive history of this complex period and explores the contrasting worlds of the British and the French Empires as they strove to develop new societies in the Americas. Charting the volatile relationship between the British and French, this book examines the approaches that both empires took as they attempted to realise their ambitions of exploration, conquest and settlement, and highlights the similarities as well as the differences between them. Both empires faced slave revolts, internal rebellion and revolution as well as frequent wars against one

another, which came to dominate the Atlantic world, and which culminated in the eventual failure of both empires in North America: the French following the Seven Years War in 1763 and the British twenty years later in the war against American Independence. Delving into key themes, such as exploration and settlement, the creation of societies, inequality and exploitation, conflict and violence, trade and slavery, and featuring a range of documents to enable a deeper insight into the relationship between the colonising Europeans and Native Americans, *The British and French in the Atlantic 1650-1800* is ideal for students of the Atlantic World, early modern Britain and France, and colonial America.

From beach encounters, aquaculture perils, and processed-food poisoning to snake bites and biological warfare, natural toxins seem never to be far from the public's sight. A better understanding of toxins in terms of their origin, structure, structure-function relationships, mechanism of action, and detection and diagnosis is of utmost importance to human and animal food safety, nutrition, and health. In addition, it is now clear that many of the toxins can be used as scientific tools to explore the molecular mechanism of several biological processes, be it a mechanism involved in the function of membrane channels, exocytosis, or cytotoxicity.

Several of the natural toxins have also been approved as therapeutic drugs, which has made them of interest to several pharmaceutical companies. For example, botulinum neurotoxins, which have been used in studies in the field of neurobiology, have also been used directly as therapeutic drugs against several neuromuscular diseases, such as strabismus and blepharospasm. Toxins in combination with modern biotechnological approaches are also being investigated for their potential use against certain deadly medical problems. For example, a combination of plant toxin ricin and antibodies is being developed for the treatment of tumors. The great potential of natural toxins has attracted scientists of varying backgrounds—pure chemists to cancer biologists—to the study of fundamental aspects of the actions of these toxins.

Nigel Calder, a diesel mechanic for more than 25 years, is also a boatbuilder, cabinetmaker, and machinist. He and his wife built their own cruising sailboat, Nada, a project they completed in 1984. Calder is author of numerous articles for Yachting Monthly and many other magazines worldwide, as well as the bestselling Boatowner's Practical and Technical Cruising Manual and Boatowner's Mechanical and Electrical Manual, both published by Adlard Coles Nautical. Here, in this goldmine of a book, is everything the reader needs to keep their diesel engine running cleanly and efficiently. It explains how diesel engines work, defines new terms, and lifts the veil

of mystery that surrounds such engines. Clear and logical, this extensively illustrated guide will enable the reader to be their own diesel mechanic. As Nigel Calder says: 'there is no reason for a boatowner not to have a troublefree relationship with a diesel engine. All one needs is to set the engine up correctly in the first place, to pay attention to routine maintenance, to have the knowledge to spot early warning signs of impending trouble, and to have the ability to correct small ones before they become large ones.'

Water plays a vital role in shaping our built environment, as it has done for centuries. We depend on it, we use it, we live with it and we must respect it. Aquitecture is the first book to outline new ways of 'designing for water,' using examples from around the world to illustrate methods of utilizing water innovatively, efficiently and safely. The first part of the book explores the historical relationship between water and architecture, examining how cities and civilisations have been drawn to water and have attempted to control it. The chapters go on to assess how this relationship has changed over time, and introduce readers to a range of brand new techniques that will revolutionise the way we think about water, design and urban planning. Solutions such as amphibious housing, wet-proof buildings, zero carbon development, rain gardens, flood storage and new methods of waterfront design are discussed and their effectiveness assessed. Full colour illustrations and international case studies are used throughout the book to bring these new theories to life; practical, technical advice sits alongside truly ground-breaking and ambitious ideas for the future. This book is an ideal reference tool for all architects, urban designers, planners and sustainability experts who have an interest in creating a beautiful, sustainable, intelligent and pleasurable built environment on land, in water and with water.
