The subject of 'Intrinsically Conducting Polymers: an Emerging Technology' was addressed at the NATO Advanced Research Workshop held in Burlington, Vermont, U.S.A. in October 1992. Approximately 30 invited scientists from 11 different countries attended the workshop and 24 lectures were given discussing in detail the most important processing techniques and applications of conducting polymers, along with the basic materials science aspects. The results was the present book, which, for the first time, addresses progress in materials science related to polymers presently on the market and to already existing applications, as well as to future applications. This book covers mostly existing and future applications of intrinsically conducting polymers. Among these applications are the redox-type, such as batteries and electrochemical actuators and artificial muscles. Capacitors, microlithography and transistor uses are addressed. The use of conducting polymers as 'smart' materials in sensor/indicator types of applications is discussed. ESD applications and EMI shielding are subjects that conducting polymers are sought after for.

Microwave properties for radar/microwave absorption and for plastics joining/welding are discussed. Also, this book discusses materials processing for the various applications, including fabrication of fibers, textiles, colloids and films/coatings. This book will be an important addition to the libraries of every institution involved in this emerging technology.

Developed as an introductory course, this up-to-date text discusses the major building blocks of present-day fiber-optic systems and presents their use in communications and sensing. Starting with easy-to-understand ray propagation in optical fibers, the book progresses towards the more complex topics of wave propagation in planar and cylindrical waveguides. Special emphasis has been given to the treatment of single-mode fibers the backbone of present-day optical communication systems. It also offers a detailed treatment of the theory behind optoelectronic sources (LEDs and injection laser diodes), detectors, modulators, and optical amplifiers. Contemporary in terms of technology, it presents topics such as erbium-doped fiber amplifiers (EDFAs) and wavelength-division multiplexing (WDM) along with dense WDM. Building upon these fundamental principles, the book introduces the reader to system design considerations for analog and digital fiber-optic communications. Emphasis has also been given to fiber-optic sensors and laser-based systems along with their industrial and other applications. This student-friendly text would be very useful to undergraduate students pursuing instrumentation, electronics, and communication engineering.
