Life is short, [the] art long —Hippocrates

*Practical Paediatric Interviewing: A Practical, Relationship Based Approach* by James Binder is filled with a unique blend of wisdom, experience, and evidence, which will serve as a guide and as a reminder that what comes first in the care of the patient is the language and the silences that are shared between patient and physician. The medical interview quickly establishes the type of caring relationship the two will share. In this age of electronic medical records, pay-for-performance, and evidence-based medicine it is easy to lose sight that medicine is fundamentally about one person who has knowledge and experience providing care for another individual who is asking for help. How the physician organizes his or her interactions has an important impact on the experience and outcome for both the physician and for the patient. Dr. Binder presents a conceptual framework with which to approach interviewing and illustrates this framework with practical examples from years of teaching and practice. Physicians-in-training will find this book filled with wisdom and much needed recommendations about how to approach the medical interview. For those of us who have been in practice a number of years, Dr. Binder's book can serve as a refreshing opportunity to reflect in detail about something many of us take for granted – the complexity of the medical interview.

Practical Paediatric Nutrition deals with conventional children's nutrition in a clinical or community setting. The book reviews nutritional assessment using three complementary methods, namely, clinical nutritional assessment (symptoms: physical wasting, rickets), anthropometric assessment (manifestations: abnormal measurements, skinfold thickness), and biochemical assessment (analysis: hematology, urine). The text also addresses nutrition in pregnancy and its effects on the fetus. The book notes that selected food supplementation has negligible effects in the mean fetal weight of malnourished populations compared with well-nourished populations. Placental insufficiency can also lead to fetal malnutrition. The text discusses breast feeding, cow's milk formulas, soya-based formulas, and "follow-on formulas." For low birth weight infants, the choice of feeds are the infants' own mothers' milk, expressed or banked; other banked breast milk; fortified human milk (own mother's or banked); standard infant formula; or preterm infant formula. The book also explores the problem of weaning and failure to gain height or weight at the expected rates. The book is helpful for pediatricians, obstetricians, gynecologists, nurses, practitioners in general medicine, and administrators of public health services.

Prescribing for children is problematic. Children are not small adults in terms of their physiology, and they cannot be subjects in clinical trials. This makes prescribing for them something of an art and a daunting one at that for trainees. Will Carroll (co-editor of the Illustrated Textbook of Paediatrics amongst other titles for paediatrics trainees) with a team of fellow paediatricians and a hospital pharmacist have sought to demystify prescribing for children. The team has identified what from their experience are the most common drugs
